

CURACO CAREBIDET DOCTOR TESTIMONIAL

Jae-myeong Lee. M.D., Ph.D.

Dept. Acute Care Surgery / Professor at Korea University's Anam Hospital

Surgical Critical Care Specialist

Website: [English](#) or [Korean](#) (more detailed, can be translated using the browser translation tool)

Dear Mr Hoonsang Lee,

I would like to share photos of my patient, 83-year-old woman (Mrs. Ko) who suffered a lot from pressure ulcer, grade IV, who has improved greatly after using Curaco.

As you know, taking care of pressure sores for hospitalized patients is very intense labor requires a lot of energy, time, and many dressing materials. Even with such hard management, it takes a very long time for pressure ulcers to improve, and in some cases they can even get worse. For us, Mrs. Ko was that kind of patient; despite of our total care and efforts, the pressure sore was getting worse and worse.

When I got to know Curaco, at that time, I had Mrs. Ko as my in-hospitalized patient, and I really wanted to try it to her, so I started to apply it right away. And I requested her son to contact you for using it even after discharge from the hospital. We started to apply it from July 11 2022 in the hospital and it could be applied to her at home after discharge to May 30, 2023.

Now you can see the dramatic improvement of pressure ulcer from the photos. It is truly remarkable. I strongly believe that Curaco is really helpful to manage pressure ulcer and it is lifesaving.

@6/20/2022 (Level 4)	@5/30/2023 (Level 1)
	

Therefore, on behalf of myself, I am hereby recommending the Carebidet as a solution to not only potentially achieve similar results as one can see above, but also prevent pressure injuries (PIs) and other infections and diseases that are common with patients that are bed-bound or severely mobility challenged.

Sincerely,

Jae-myeong Lee. M.D., Ph.D.
